

Personal Skincare Assistant

Datasets

Dataset 1: **Skin Type & Condition Dataset**

This dataset helps to analyse a user's skin type and conditions based on their responses to a questionnaire. It consists of 1000 entries, where each entry represents a user's skin characteristics and lifestyle factors. These characteristics help to categorize the skin type and condition, enabling personalized recommendations.

Fields:

- Age, Gender
- Skin characteristics (Skin Feels After Washing, Oiliness T-Zone, Dry Patches, Greasy by Midday, Breakouts Frequency, Redness Sensitivity, Hyperpigmentation, Fine Lines)
- Lifestyle factors (Sun Exposure Daily, Water Intake Per Day, Diet Influence, Sleep Hours Per Night, Stress Level)
- Skin type and condition

Dataset 2: **Product Dataset**

This dataset contains product details. Based on the user's skin analysis, the system will recommend products that match their skin type and specific concerns.

Fields:

- Skin Type: Categories of skin types (e.g., Dry, Oily, Combination, Sensitive, Normal)
- Product: Name of the skincare product
- Concern: Skin issue addressed (e.g., Acne, Hydration, Sun Protection)
- Product URL & Image: Links and images of the product

Database Structure

- **User table:** This table stores the user information (Fields: user id, user name, email, password)

- **Questions table:** This table stores the questionnaire's questions along with the possible answer options (Fields: questions, answer options)
- **Skin analysis table:** This table stores the user's skin analysis results based on their questionnaire responses. (Fields: user id, skin type, skin condition)
- **Product table:** The product table contains details about the skincare products. It is used to recommend products based on the user's skin analysis results. (Fields: product id, skin type, concern, product name, product URL)
- **Order table:** The order table will store the details of a user's order (Fields : user id, products, amount, address, order status, order date)
